BLUE RIDGE AT LAKE ARROWHEAD TRAFFIC IMPACT ANALYSIS

INTRODUCTION

This traffic impact analysis (TIA) has been prepared to assess the potential traffic and circulation impacts associated with the development of the proposed Blue Ridge at Lake Arrowhead residential development. This report is intended to satisfy the requirement for a traffic impact analysis established by the County of San Bernardino and the requirement for the disclosure of potential impacts and mitigation measures per the California Environmental Quality Act (CEQA).

Prior to preparation of the TIA, a preliminary assessment was performed to determine the estimated trip generation for the proposed <u>project</u>. At build out, the proposed 58 single family dwelling unit project is forecast to generate 44 vehicle trips during the a.m. peak hour and 59 trips during the p.m. peak hour. This is less than the 250 peak hour trip threshold established by the San Bernardino County Congestion Management Program (CMP) for preparation of a traffic impact analysis.

This report analyzes project related traffic impacts for the proposed project under existing 2001 and cumulative year 2020 conditions, which includes the development of the approved Mill Pond project. The Mill Pond project is a mixed-use project containing single family homes, lodging, retail/ restaurant and office land uses located north of the project site. Traffic data for this approved project were taken from the Mill Pond at Lake Arrowhead Traffic Study prepared by Lawerence Eisenhart, P.E., in July, 1996¹.

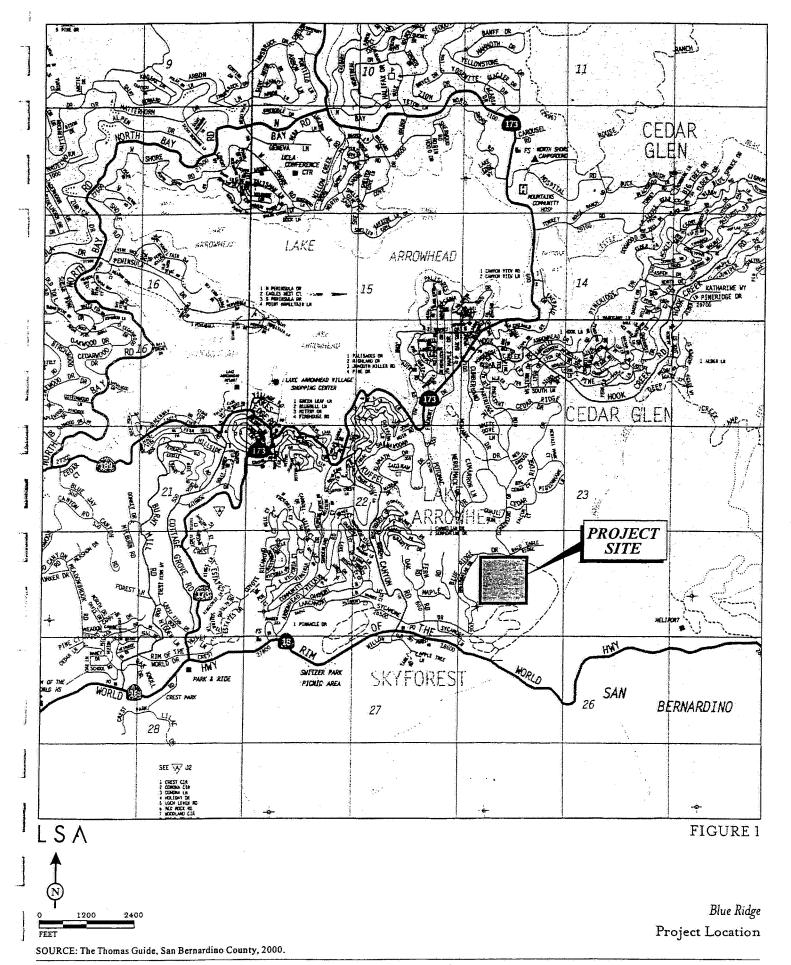

Project Description

The Blue Ridge at Lake Arrowhead residential development project is proposed to be located at the southern terminus of Cumberland Drive, east of Blue Ridge Drive in the community of Cedar Glen, in the Lake Arrowhead area of San Bernardino County (see Figure 1). Figure 2 illustrates the project site plan. The project proposes to develop 58 single family dwelling units on approximately 39.8 acres of land. Regional access to and from the site will be provided from State Highway 173 (SR-173); local access will be provided via an extension of Cumberland Drive. Currently, Blue Ridge Drive is gated at its intersection with Cumberland Drive. Blue Ridge Drive is designated as an emergency access, and through traffic is prohibited. With development of the project, Blue Ridge Drive will continue to be gated for emergency access only.

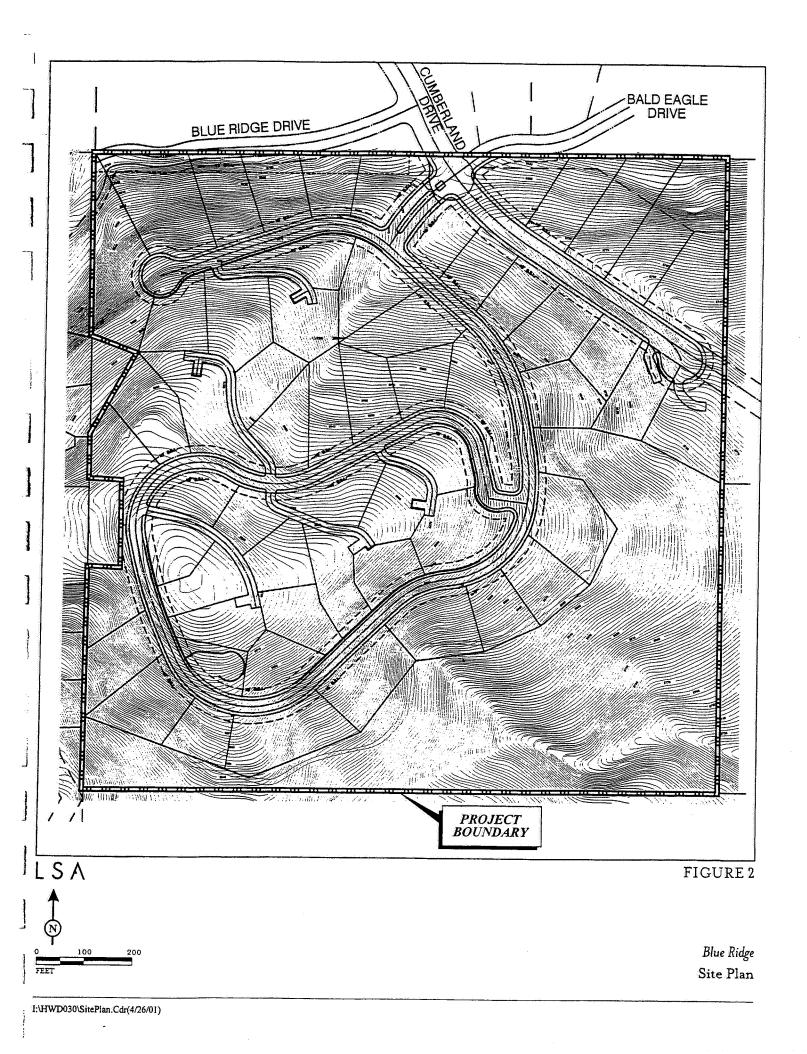

Analysis Methodology

This TIA was prepared consistent with criteria established by the County of San Bernardino. In addition to ambient growth for the future analysis year (2020), the County has requested that traffic generated by the approved Mill Pond at Lake Arrowhead project (Tentative Tract No. 15740) be added to the background year 2020 condition. The forecast traffic assignment from the Mill Pond project was taken from the Mill Pond at Lake Arrowhead traffic study (Lawrence Eisenhart, P.E., July 1996). This study evaluates four scenarios:

- Peak season 2001 conditions
- Peak season 2001 plus project conditions
- Future year 2020 background (without project) conditions with approved Mill Pond project
- Future year 2020 plus project conditions with approved Mill Pond project.

This analysis examines a.m. and p.m. peak hour conditions for each scenario.

Study Area

The study area for the traffic analysis was defined in consultation with the County of San Bernardino Traffic Engineer. The intersection of SR-173/Hook Creek Road-Oak Drive has been selected for analysis for the four scenarios in the a.m. and p.m. peak hours. SR-173/Hook Creek Road-Oak Drive is an unsignalized intersection with stop control on the minor street approaches (Hook Creek Road and Oak Drive). In addition, a slight offset exists where Hook Creek Road and Oak Drive connect with SR-173. The location and geometrics of SR-173/Hook Creek Road-Oak Drive are illustrated on Figure 3.

Level of Service Definitions and Procedures

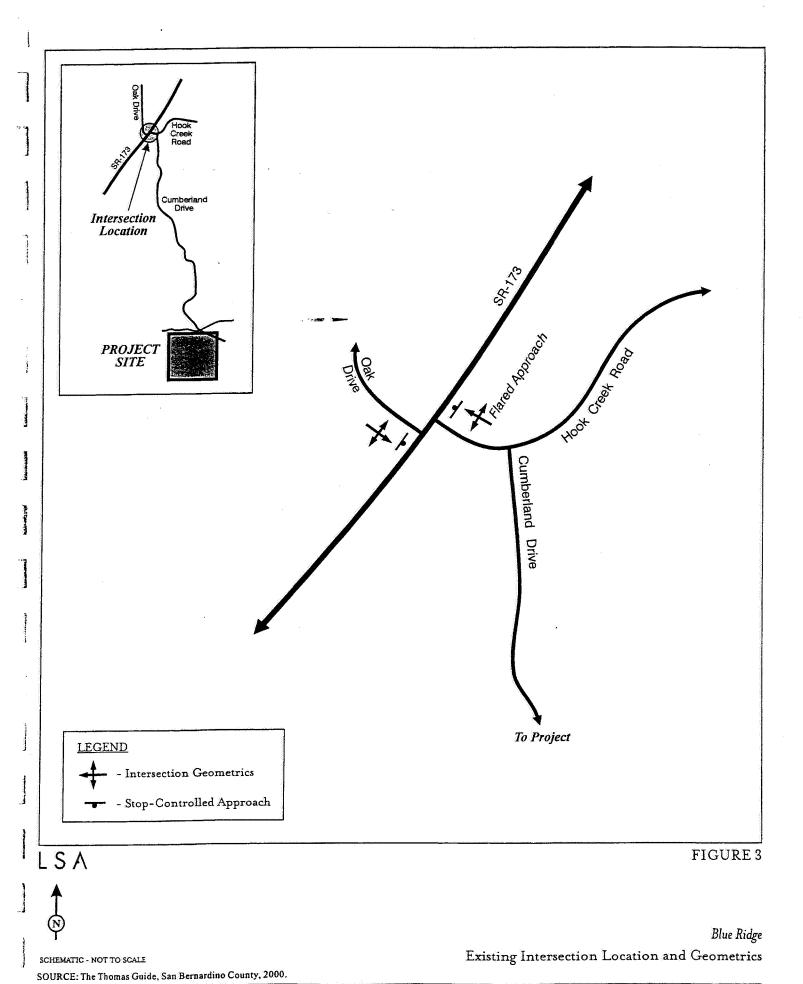

Roadway operations and the relationship between capacity and traffic volumes are generally expressed in terms of levels of service. These levels recognize that, while an absolute limit exists as to the amount of traffic moving through a given intersection (the absolute capacity), the conditions that motorists experience rapidly deteriorate as traffic approaches the absolute capacity. Under such conditions, congestion is experienced. There is general instability in the traffic flow, which means that relatively small incidents (e.g., momentary engine stall) can cause considerable fluctuations in speeds and delays. This near capacity situation is labeled LOS E (levels of service are designated A through F). Beyond LOS E, capacity has been exceeded, and arriving traffic will exceed the ability of the intersection to accommodate it. An upstream queue will then form and continue to expand in length until the demand volume declines.

A complete description of the meaning of level of service can be found in the Highway Research Board Special Report 209, *Highway Capacity Manual*. The Manual establishes levels of service A through F. Brief descriptions of the six levels of service, as abstracted from the Manual, are as follows:

Level of Service Definitions

LOS Description

- A No approach phase is fully utilized by traffic and no vehicle waits longer than one red indication. Typically, the approach appears quite open, turns are made easily and nearly all drivers find freedom of operation.
- B This service level represents stable operation, where an occasional approach phase is fully utilized and a substantial number are approaching full use. Many drivers begin to feel restricted within platoons of vehicles.

I:\HWD030\Ex-Geo.Cdr(3/22/01)

- C This level still represents stable operating conditions. Occasionally drivers may have to wait through more than one red signal indication, and backups may develop behind turning vehicles. Most drivers feel somewhat restricted, but not objectionably so.
- D This level encompasses a zone of increasing restriction approaching instability at the intersection. Delays to approaching vehicles may be substantial during short peaks within the peak period; however, enough cycles with lower demand occur to permit periodic clearance of developing queues, thus preventing excessive backups.
- E Capacity occurs at the upper end of this service level. It represents the most vehicles that any particular intersection approach can accommodate. Full utilization of every signal cycle is seldom attained no matter how great the demand.
- F This level describes forced flow operations at low speeds, where volumes exceed capacity. These conditions usually result from queues of vehicles backing up from a restriction downstream. Speeds are reduced substantially and stoppages may occur for short or long periods of time due to the congestion. In the extreme case, both speed and volume can drop to zero.

The level of service for unsignalized and signalized intersections can be described as follows:

| Level of Service | Unsignalized Intersection Control Delay Per Vehicle (sec.) | Signalized Intersection Control Delay Per Vehicle (sec.) |
|------------------|---|---|
| A | ≤ 10 | ≤10 |
| В | $> 10 \text{ and } \le 15$ | $> 10 \text{ and } \le 20$ |
| С | > 15 and ≤ 25 | $> 20 \text{ and } \le 35$ |
| D | > 25 and ≤ 35 | > 35 and ≤ 55 |
| E | > 35 and ≤ 50 | > 55 and ≤ 80 |
| F | > 50 | > 80 |

For the unsignalized study area intersection, the *Highway Capacity Manual* (HCM 2000) unsignalized analysis methodology was used to determine intersection levels of service. All levels of service were calculated using the Highway Capacity Software (HCS2000) and/or TRAFFIX version 7.5 level of service software, which also uses the HCM 2000 methodologies.

Level of Service Threshold Criteria

The County of San Bernardino defines LOS C as the threshold for satisfactory intersection operations. Therefore, any level of service condition in excess of LOS C is considered an impact requiring mitigation.

EXISTING CONDITIONS

Existing Roadway System

An inventory of the existing study area street system was conducted by LSA in February 2001. Adjacent to the project, Cumberland Drive is a two lane undivided roadway that provides local access to

Cedar Glen and Lake Arrowhead. Currently, Blue Ridge Drive west of the project site is gated at its intersection with Cumberland Drive-Bald Eagle Ridge. Blue Ridge Drive is designated as an emergency access route, and through traffic is prohibited. Cumberland Drive provides access to SR-173, which provides regional access within the Lake Arrowhead area, including State Highway 18 (SR-18). SR-18 provides regional access to the Big Bear Lake area to the northeast and the employment centers of San Bernardino County to the west and south.

Existing Peak Season Traffic Conditions

Peak hour traffic counts for SR-173/Hook Creek Road-Oak Drive were collected by LSA in February 2001. Traffic count data sheets are provided in Appendix A. For traffic analyses, San Bernardino County requires examination of peak season (June to September) conditions. Caltrans count data for the highways in the project vicinity indicate that peak season volumes are approximately 20 percent greater than non-peak season volumes. The February counts were increased by 20 percent to reflect peak season conditions. Figure 4 illustrates the existing peak season a.m. and p.m. peak hour turn volumes for the study area intersection. Table A presents the existing condition intersection level of service analysis summary. Actual level of service worksheets are provided in Appendix B.

Table A: Existing Peak Season 2001 Intersection Levels of Service

| | | A.M. Peak | Hour | P.M. Peak Hour | | |
|----------------------------------|-----------|-----------|------|----------------|-----|--|
| Intersection | Approach | Delay | LOS | Delay | LOS | |
| SR-173/Hook Creek Road-Oak Drive | Eastbound | 11.6 sec. | В | 12.6 sec. | В | |
| | Westbound | 7.3 sec. | Α | 9.3 sec. | A | |

As this summary indicates, the delays at the unsignalized intersection's minor street approaches are currently within the County's LOS C threshold.

PROJECT TRAFFIC

Project Trip Generation

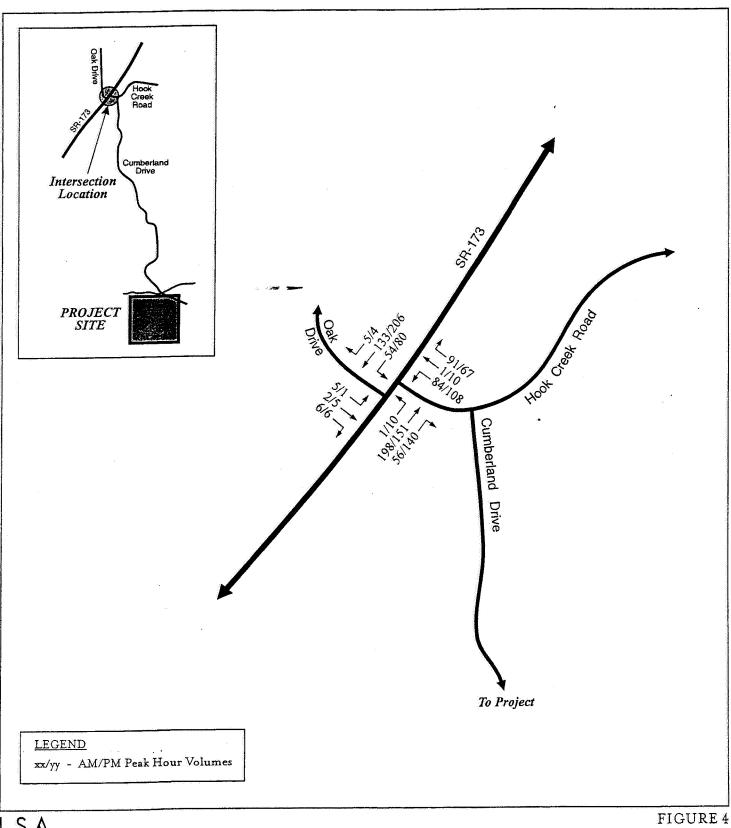

Trip generation for the proposed Blue Ridge residential project was developed using trip rates provided in the Institute of Transportation Engineers (ITE) *Trip Generation, Sixth Edition.* 1 A summary of the trip generation rates and resulting vehicle trips for the proposed project is presented in Table B.

Table B: Blue Ridge at Lake Arrowhead Trip Generation

| | | A.M. Peak Hour | | | P.M. Peak Hour | | |
|---------------------------------|------|----------------|------|-------|----------------|------|---------|
| Land Use/Size | ADT | In | Out | Total | In | Out | Total |
| TRIP RATES | | | | | | | <u></u> |
| Per Single Family Dwelling Unit | 9.57 | 0.19 | 0.56 | 0.75 | 0.65 | 0.36 | 1.01 |
| TRIP GENERATION | | | | | | | |
| 58 Single Family Dwelling Units | 555 | 11 | 33 | 44 | 38 | 21 | 59 |

According to Table B, the proposed project would generate approximately 555 average daily trips (ADT), 44 a.m. peak hour trips, and 59 p.m. peak hour trips.

¹ Trip Generation (6th Edition), Institute of Transportation Engineers, Washington, D.C., 1997.

Blue Ridge

Existing Peak Season AM and PM Peak Hour Traffic Volumes

SCHEMATIC - NOT TO SCALE

SOURCE: The Thomas Guide, San Bernardino County, 2000.

A

Project Trip Distribution and Assignment

Trip distribution and assignment patterns were developed based on the location of the proposed project site relative to the existing commute and local travel patterns made by existing residential land uses in the immediate area. Figure 5 illustrates the generalized trip distribution patterns and the resulting trip assignment.

According to Figure 5, approximately 30 percent of project traffic is forecast to travel to/from the northeast on SR-173 towards other parts of Cedar Glen and the north shore area of Lake Arrowhead, while 70 percent of the project traffic is forecast to travel to/from the southwest on SR-173 towards Lake Arrowhead and SR-18.

EXISTING PLUS PROJECT CONDITIONS

Potential project impacts to the local circulation system in the existing condition are determined by adding the trip assignment to the existing (2001) background traffic condition. Figure 6 illustrates the resulting existing plus project a.m. and p.m. peak hour traffic volumes.

Existing Peak Season Plus Project Levels of Service

Table C shows the existing plus project a.m. and p.m. peak hour levels of service for the SR-173/Hook Creek Road-Oak Drive intersection.

Table C: Existing Peak Season Plus Project Intersection Levels Of Service

| Intersection | | E | xisting (| Conditions | | Ex | isting P | lus Project | |
|--------------|-----------|--------------|-----------|--------------|-----|--------------|----------|--------------|-----|
| | | AM Peak Hour | | PM Peak Hour | | AM Peak Hour | | PM Peak Hour | |
| | Approach | Delay | LOS | Delay | LOS | Delay | LOS | Delay | LOS |
| SR-173/ | Eastbound | 11.6 sec. | В | 12.6 sec. | В | 11.8 sec. | В | 13.0 sec. | В |
| Hook Creek | Westbound | 7.3 sec. | A | 9.3 sec. | A | 7.3 sec. | Α | 9.7 sec. | A |

As Table C indicates, addition of project traffic to existing traffic at the SR-173/Hook Creek Road-Oak Drive intersection will not cause the minor street approaches to operate at unsatisfactory levels of service. The minor streets at this intersection are forecast to continue to operate at LOS B or better during the a.m. and p.m. peak hours in the existing plus project condition.

YEAR 2020 BACKGROUND CONDITIONS

In addition to the existing conditions, project impacts were also assessed relative to forecast year 2020 conditions. Traffic volume data for the 2020 background (without project) condition are based on forecasts supplied from the San Bernardino Mountain Traffic Model. The San Bernardino Mountain traffic model was developed to forecast future traffic conditions for the mountain area. This model uses a 1990 base condition and a 2010 future condition. To determine the a.m. and p.m. peak season, peak hour intersection turn movements for the 2020 background conditions, the following methodology was used:

1. The modeled 1990 and 2010 arterial Average Daily Traffic (ADT) volumes for each intersection leg were examined to determine the annual growth rate projected by the model.

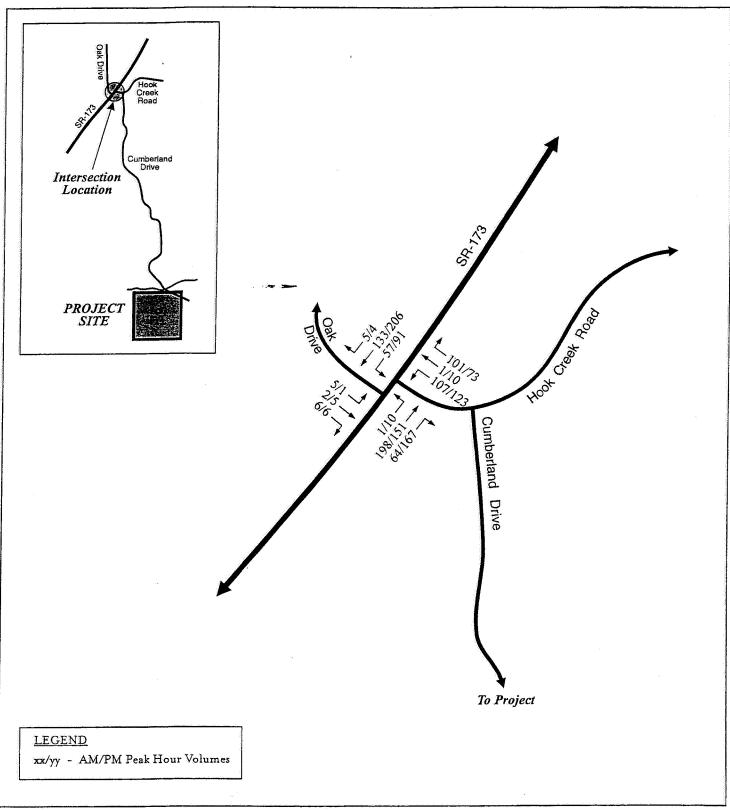

FIGURE 6

Blue Ridge Existing Peak Season Plus Project

AM and PM Peak Hour Traffic Volumes

SCHEMATIC - NOT TO SCALE

SOURCE: The Thomas Guide, San Bernardino County, 2000.

- 2. The annual growth rate for each intersection leg was multiplied by 19 (2020 minus 2001) to develop growth rates for the year 2020 planning horizon.
- 3. Existing peak season intersection approach and departure volumes (based on actual ground counts) were multiplied by the appropriate modeled 19 year growth factor, resulting in "post-processed" forecast year 2020 link volumes.
- 4. Forecast year 2020 turn volumes were developed using existing turn volumes and the future approach and departure volumes based on the methodologies contained in the National Cooperative Highway Research Program Report (NCHRP) 255: Highway Traffic Data for Urbanized Area Project Planning and Design¹. The worksheets used to develop the forecast 2020 background traffic volumes are contained in Appendix C.
- 5. In addition to year 2020 ambient growth, the County has requested that traffic generated by the approved Mill Pond at Lake Arrowhead project (Tentative Tract No. 15740) be added to the background year 2020 condition. The forecast traffic assignment from the Mill Pond project was taken from the Mill Pond at Lake Arrowhead Traffic Study (Lawrence Eisenhart, P.E., July, 1996), and is provided in Appendix D.

Figure 7 illustrates the resulting 2020 background (with Mill Pond) a.m. and p.m. peak hour intersection turn volumes. Table D presents the 2020 background intersection level of service analysis summary. Actual level of service worksheets are provided in Appendix B.

Table D: Year 2020 Background Intersection Levels of Service

| | | A.M. Peak | Hour | P.M. Peak Hour | |
|----------------------------------|-----------|-----------|------|----------------|-----|
| Intersection | Approach | Delay | LOS | Delay | LOS |
| SR-173/Hook Creek Road-Oak Drive | Eastbound | 39.1 sec. | Е | 39.0 sec. | D |
| | Westbound | 35.0 sec. | D | >80 sec. | F |

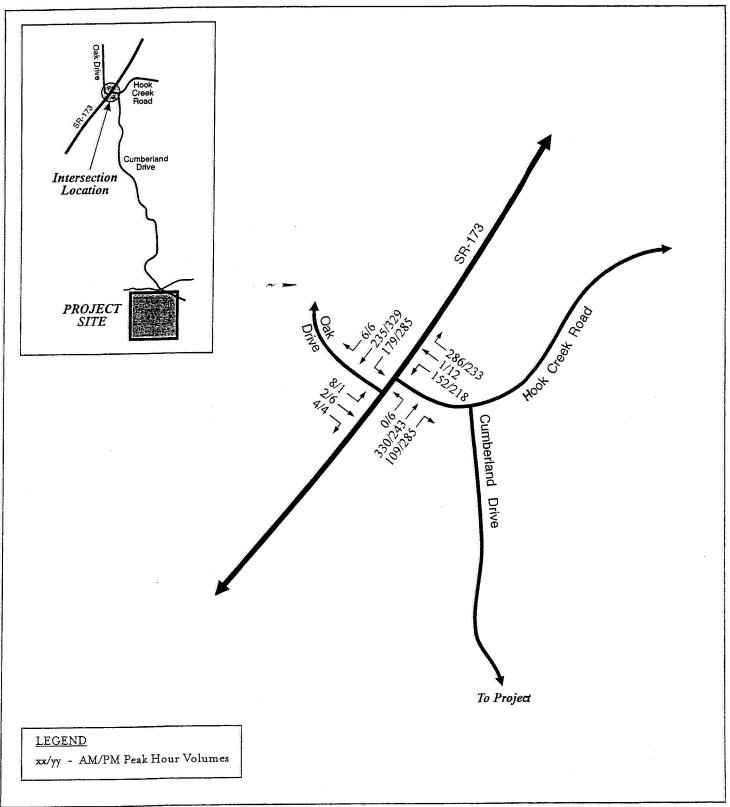

As indicated in Table D, both the eastbound and westbound approaches are projected to operate below level of service C during both the a.m. and p.m. peak hours under year 2020 background conditions. Per the County significance criteria, this intersection is forecast to operate at an unsatisfactory level of service.

Year 2020 Background Conditions Signal Warrant Analysis

The desirability of signalizing existing intersections can be related to safety and traffic volume considerations. The need for signalization is determined through signal warrant analysis procedures established by the Federal Highway Administration (FHWA) and Caltrans. The Caltrans *Traffic Manual* provides 11 signal warrants for use in determining whether intersections should be signalized. According to the *Traffic Manual*:

"The justification for the installation of a traffic signal at an intersection is based on the warrants stated in this Manual and in the Manual On Uniform Traffic Control Devices published by the Federal Highway Administration (FHWA). The decision to install a signal should not be based solely upon the warrants, since the installation of traffic signals may increase certain types of collisions. Delay, congestion, approach conditions, driver confusion, future land use or other evidence of the need for right of way assessment beyond that which could be provided by stop signs must be demonstrated."

¹ Transportation Research Board, December, 1982.

LSA

FIGURE 7

Blue Ridge
Year 2020 Baseline (With Mill Pond)

AM and PM Peak Hour Traffic Volumes

SCHEMATIC - NOT TO SCALE

SOURCE: The Thomas Guide, San Bernardino County, 2000.

Since this traffic analysis examines peak hour intersection volumes and impacts, the peak hour warrants were examined (per *Traffic Manual* Figure 9-9). It should be noted that the Caltrans Peak Hour Signal Warrant (Warrant 11) is the most stringent warrant in terms of analyzing the volume of traffic at an intersection. Generally, traffic conditions at the subject intersection are monitored (i.e., accident statistics, pedestrian volumes, 24 hour traffic volumes, etc.) after it is determined that signalization is warranted. At that time, and at the discretion of the jurisdiction's Traffic Engineer, all 11 signal warrants may be analyzed.

Peak hour signal warrants are based on the minimum approach volume requirements for the major street (total of both approaches) and the minor street (one direction only). These volume requirements have been established for two levels of development: urban and rural. According to Caltrans' *Traffic Manual*, "When the 85 percentile speed of major street exceeds 64 km/h (40 mph) in either an urban or rural area, or when the intersection lies within a built-up area of an isolated community having a population less than 10,000, the location is considered rural. All other areas are considered urban." Based on our observations of the operations of SR-173 in the project vicinity and our observations of the SR-173/Hook Creek Road-Oak Drive intersection, it was determined that the prevailing speeds on SR-173 in the vicinity of Hook Creek Road are about 40 mph. Therefore, this location meets the criteria for rural area intersections. Determination of whether an intersection warrants signalization is based on the plotting of major and minor street volumes on a graph (Figure 9-9 of the *Traffic Manual*). If the plotted point exceeds the threshold line, signalization is warranted in the peak hour.

Figure 8 illustrates the peak hour signal warrant graph for the intersection of SR-173/Hook Creek Road-Oak Drive for the 2020 background scenario. As this figure shows, the intersection will have sufficient approach volumes on the major street (SR-173), and the westbound approach (Hook Creek Road) may warrant signalization under 2020 background conditions with Mill Pond. According to the Conditions of Approval for the Mill Pond project (COA 96, page 14, November 3, 1998), the developer is required to deposit a fair-share contribution of approximately \$140,000 for the future traffic signal at this location.

YEAR 2020 PLUS PROJECT CONDITIONS

Potential project impacts to the local circulation system in the year 2020 condition were determined by adding the project trip assignment to the year 2020 background traffic conditions discussed previously. Figure 9 illustrates the year 2020 background plus project a.m. and p.m. peak hour intersection turn volumes. Table E presents the 2020 plus project intersection level of service analysis summary. Actual level of service worksheets are provided in Appendix B.

Table E: Year 2020 Plus Project Intersection Levels of Service

| | | Year 2020 | Backg | round Cond | litions | Year 2020 Plus Project | | | | |
|--------------|-----------|--------------|-------|--------------|---------|------------------------|-----|--------------|-----|--|
| 1 | | AM Peak Hour | | PM Peak Hour | | AM Peak Hour | | PM Peak Hour | | |
| Intersection | Approach | Delay | LOS | Delay | LOS | Delay | LOS | Delay | Los | |
| SR-173/ | Eastbound | 39.1 sec. | Е | 39.0 sec. | E | 36.9 sec. | E | 42.5 sec. | E | |
| Hook Creek | Westbound | 35.0 sec. | D | >80 sec. | F | >80 sec. | F | >80 sec. | F | |

As indicated in Table E, both the eastbound and westbound approaches are projected to operate below level of service C during both the a.m. and p.m. peak hours under year 2020 plus project conditions.

Per the County significance criteria, this intersection is forecast to operate at an unsatisfactory level of service. Therefore, development of the proposed project in the year 2020 condition will contribute to the unsatisfactory level of service forecast at the SR-173/Hook Creek Road intersection. The project will be required to contribute its fair-share cost to the prescribed mitigation.

Year 2020 Plus Project Signal Warrant Analysis

Figure 8 illustrates the peak hour signal warrant graph for the intersection of SR-173/Hook Creek Road-Oak Drive for the 2020 background and 2020 plus project scenarios. As this figure shows, the intersection will have sufficient approach volumes on the major street (SR-173), and the westbound approach (Hook Creek Road) may warrant peak hour signalization under 2020 background and background plus project conditions.

Project Contribution to Total New Volumes

As part of the traffic impact analysis, the contribution of project increment traffic to total new traffic was determined for the intersection of SR-173/Hook Creek Road-Oak Drive. Table F presents the results of this analysis.

Table F: Project Contribution to Total New Traffic Volumes at Study Area Intersection

| | | A. | M. Peak | Hour | | | P. | M. Peak | Hour | |
|-------------------------------|-------------------|---------------|--------------|------------------|-------------------|-------------------|---------------|--------------|------------------|-------------------|
| Int. | Total Existing | Total 2020 | Total New | Total Project | Ratio Proj/New | Total Existing | Total 2020 | Total New | Total Project | Ratio Proj/New |
| SR-173/ Hook Creek Road | 636 | 1,355 | 719 | 44 | 6.12% | 788 | 1,688 | 900 | 59 | 6.56% |

The total existing and total year 2020 plus project peak hour traffic is the sum of all turn movements for the intersection's approaches. The total new traffic is the difference between the year 2020 and the existing peak hour traffic volumes. Total project traffic is the sum of the project increment peak hour traffic volume through the study area intersection. The project contribution to total new traffic is calculated by dividing the project increment by the total new traffic.

These calculations consider only the growth in traffic up to the levels of the SCAG estimates for population housing and employment for 2020. In an ultimate General Plan build out horizon, growth in traffic may exceed these volumes, reducing the percentage of contribution of the proposed project. Therefore, these percentages should be evaluated in this context before application to mitigation costs to reflect the total project fair-share contribution.

Proposed Cumberland Drive Extension Project

According to the Circulation Element of the County of San Bernardino General Plan, an extension of Cumberland Drive, south of Blue Ridge Drive, has been identified as a Primary Evacuation Route for the Town of Lake Arrowhead. According to the County Planning Department¹, the alignment shown in the General Plan is for conceptual purposes only. The County is currently in the process of analyzing a series of roadway alignments for the extension project. Once approved, it is anticipated that

¹ Telephone conversation with Pat McGukian, Senior Planner, County of San Bernardino, April, 2001.

the final alignment will provide a connection from the existing terminus at Blue Ridge Drive to State Route 18 (SR-18) in the vicinity of the existing Santa's Village property.

It should be noted that the proposed project has provided the necessary right-of-way for the roadway extension project. Also, the project traffic analysis has demonstrated that the project does not create a significant impact to the local circulation system. A peak hour signal warrant analysis indicates that a traffic signal may be warranted at the SR-173/Hook Creek Road intersection in the 2020 baseline and 2020 plus project scenarios. Installation of this feasible improvement would allow for satisfactory levels of service at this intersection.

CIRCULATION IMPROVEMENTS

Based on the results of the traffic impact analysis, the following improvement is recommended to improve traffic operations at the SR-173/Hook Creek Road-Oak Drive intersection.

Signalization

The project's mitigation would be to pay its fair-share to the cost to improve the forecast operations (i.e., signalization) of SR-173/Hook Creek Road-Oak Drive. Based on the existing and year 2020 traffic volumes analyzed in this TIA, the project contribution to this intersection is 6.12 percent in the a.m. peak hour and 6.56 percent in the p.m. peak hour.

Levels of Service with Improvements

Table G presents the 2020 plus project of level of service for the study area intersection with the recommended intersection improvements (i.e., signalization).

Table G: Year 2020 Plus Project with Signalization Intersection Levels of Service

| | | Ye | ear 2020 | + Project | | | - | ect w/ Mitig | - . |
|--------------|-----------|-----------|----------|-----------|------|-----------|-----------|---------------|----------------|
| | | AM Peak | Hour | PM Peak | Hour | AM Peak | Hour | PM Peak | Hour |
| Intersection | Approach | Delay | LOS | Delay | LOS | Delay | LOS | Delay | LOS |
| SR-173/ | Eastbound | 36.9 sec. | E | 42.5 sec. | E | 14.1 sec. | В | 14.4 sec. | В |
| Hook Creek | Westbound | >80 sec. | F | >80 sec. | F | LOS | for entir | e intersectio | n |

With the implementation of the recommended intersection improvement, the minimum level of service standard is maintained where a significant project impact was identified.

Project Fair-Share Contribution

The County of San Bernardino assumes a fixed cost of \$250,000 to install a new traffic signal. As indicated in Table F, the project will contribute 6.56 percent of the new p.m. peak hour trips to the intersection of SR-173/Hook Creek Road-Oak Drive in 2020. Therefore, the project's fair-share contribution to the mitigation is \$1.00.

SUMMARY AND CONCLUSIONS

This section of the report summarizes the results and conclusions of the traffic analysis for the proposed Blue Ridge at Lake Arrowhead residential development project. The key results are summarized below.

- Existing (2001) a.m. and p.m. peak hour intersection turn volumes for analysis locations were collected by LSA. The SR-173/Hook Creek Road-Oak Drive intersection is currently operating with satisfactory levels of service.
- The proposed project is estimated to generate 555 average daily trips, 44 a.m. peak hour trips, and 59 p.m. peak hour trips.
- SR-173/Hook Creek Road-Oak Drive is forecast to continue to operate with satisfactory levels of service with the addition of project trips in the existing plus project scenario for both peak hours.
- Under forecast year 2020 background (without project) conditions with the Mill Pond project, the
 eastbound and westbound approaches of SR-173/Hook Creek Road-Oak Drive intersection are
 forecast to operate at unsatisfactory (LOS F) levels of service in both the a.m. and p.m. peak
 hours.
- The proposed project would contribute to the unsatisfactory operation of SR-173/Hook Creek Road-Oak Drive in the 2020 plus project scenario. However, the project would not create a direct impact that results in the degradation in levels of service to a condition worse than the background (without project) condition.
- A peak hour signal warrant analysis was performed for the study area intersection. Based on the Caltrans peak hour signal warrant, SR-173/Hook Creek Road-Oak Drive is forecast to have sufficient approach volumes that may warrant signalization under 2020 background and 2020 plus project conditions.
- According to the Circulation Element of the County of San Bernardino General Plan, an extension of Cumberland Drive, south of Blue Ridge Drive, has been identified as a Primary Evacuation Route for the Town of Lake Arrowhead. The County is currently in the process of analyzing a series of roadway alignments for the extension project. It should be noted that the proposed project has provided the necessary right-of-way for the roadway extension project. Also, the project traffic analysis has demonstrated that the project does not create a significant impact to the local circulation system.
- A mitigation measure has been recommended for this intersection significantly impacted by project traffic. The improvement includes the following:

Signalization. The project's mitigation would be to pay its fair-share to the cost of improving the operations (i.e., signalization) of SR-173/Hook Creek Road-Oak Drive. Based on the existing and year 2020 traffic volumes analyzed in this TIA, the project contribution to this intersection is 6.12 percent in the a.m. peak hour and 6.56 percent in the p.m. peak hour.

Based on the County of San Bernardino's standard cost of \$250,000 for installation of a new traffic signal, the project shall make a fair-share contribution of \$16,400 for the future traffic signal at this location.

TRIP GENERATION:

Trip generation factors for various land uses have been established from studies made by governmental agencies, research institutes and consulting traffic engineers nationwide. These data have been complied in the Institute of Transportation engineer's publication, "TRIP GENERATION, 5TH EDITION", 1991, the most current edition.

Factors used in this study are included in the APPENDIX.

Using the trip generation factors the table below shows the calculated trips used in this study.

| LAND USE | SIZE | PK. HR. FACTOR | TOTAL | ENTER | EXIT |
|---|--------------|-------------------|-------|-------------------|-------------------|
| SINGLE FAMILY DETACHED HOUSING (210) | * 75 D.U. | 1.01 | 76 | 64 % 49 | 36 % 27 |
| BED AND BREAKFAST COTTAGES (330) | 12 RMS. | 0.48 | 6 | 37 % 2 | 63 % 4 |
| SPECIALTY RETAIL CENTER (814) | 9 TSF. | 4.93 | 44 | 57% 25 | 43% 19 |
| HIGH-TURNOVER (SIT-DOWN) RESTAURANT (832) | 150 STS. | 0.59 | 88 | 54 % 48 | 46% 41 |
| QUALITY RESTAURANT (831) | 48 STS. | 0.23 | 11 | 70% 8 | 30% 3 |
| OFFICE (710) | 4 TSF. | 3.40 | 14 | 17% 2 | 83% 12 |
| TOTAL | | | 240 | 134 | 106 |

* 6 OF THE DWELLING UNITS WILL EXIT VIA FREMONT DRIVE.

LEGEND:

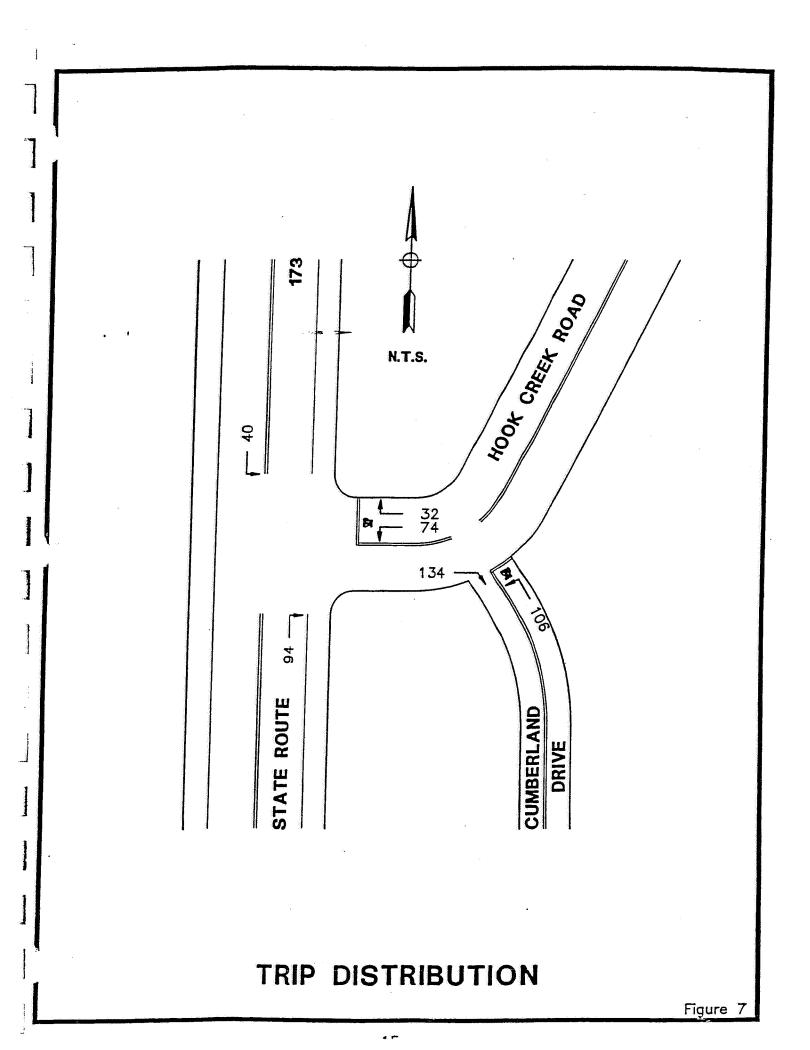

D.U. = DWELLING UNITS

RMS. = ROOMS STS. = SEATS

TSF. = THOUSAND SQUARE FEET
